

MAX44248

36V, Precision, Low-Power, 90 μ A, Dual Op Amp

General Description

The MAX44248 is an ultra-precision, low-noise, zero-drift dual operational amplifier featuring very low-power operation with a wide supply range. The device incorporates a patented auto-zero circuit that constantly measures and compensates the input offset to eliminate drift over time and temperature as well as the effect of 1/f noise. The device also features integrated EMI filters to reduce high-frequency signal demodulation on the output. The op amp operates from either a single 2.7V to 36V supply or dual ± 1.35 V to ± 18 V supply. The device is unity-gain stable with a 1MHz gain-bandwidth product and a low 90 μ A supply current per amplifier.

The low offset and noise specifications and high supply range make the device ideal for sensor interfaces and transmitters.

The device is available in 8-pin μ MAX® and SO packages and is specified over the -40°C to +125°C automotive operating temperature range.

Applications

Sensors Interfaces
 4-20mA and 0 to 10V Transmitters
 PLC Analog I/O Modules
 Weight Scales
 Portable Medical Devices

Features

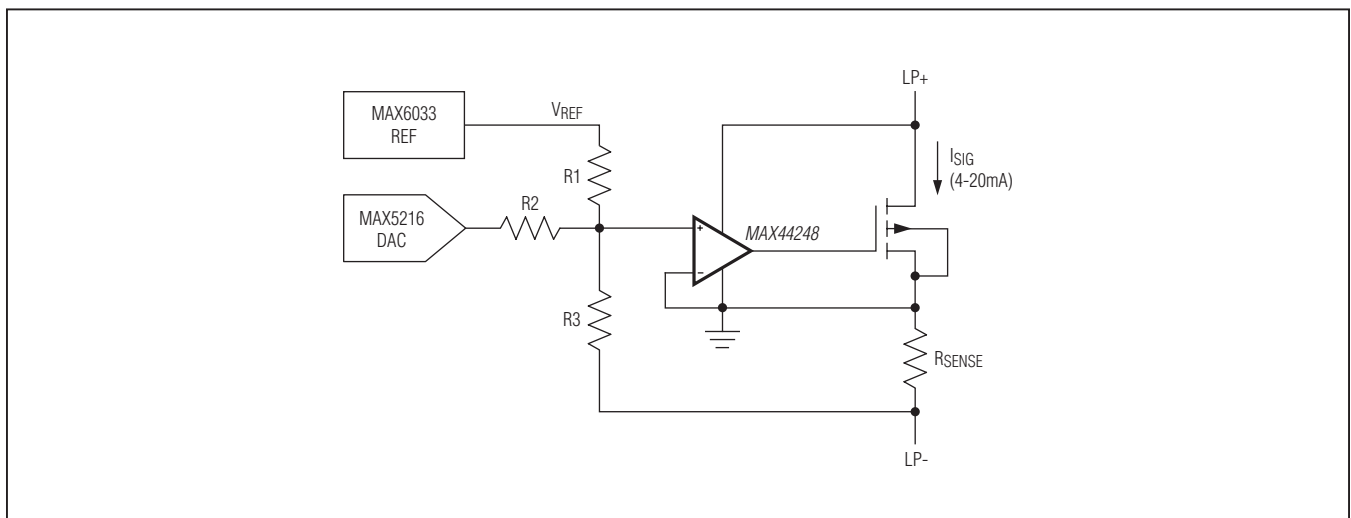

- ◆ Very Low Input Voltage Offset 7.5 μ V (max)
- ◆ Low 30nV/°C Offset Drift (max)
- ◆ Low 90 μ A Quiescent Current per Amplifier
- ◆ Low Input Noise
 50nV/ $\sqrt{\text{Hz}}$ at 1kHz
 0.5 μ V_{p-p} from 0.1Hz to 10Hz
- ◆ 1MHz Gain-Bandwidth Product
- ◆ EMI Suppression Circuitry
- ◆ Rail-to-Rail Output
- ◆ 2.7V to 36V Supply Range
- ◆ 8-Pin μ MAX and SO package

36V, Precision, Low-Power, 90µA, Dual Op Amp

ABSOLUTE MAXIMUM RATINGS

V_{DD} to V_{SS}	-0.3V to +40V	Operating Temperature Range	-40°C to +125°C
Common-Mode Input Voltage	($V_{SS} - 0.3V$) to ($V_{DD} + 0.3V$)	Storage Temperature	-65°C to +150°C
Differential Input Voltage IN_+ , IN_-	6V	Junction Temperature	+150°C
Continuous Input Current Into Any Pin	±20mA	Lead Temperature (soldering, 10s)	+300°C
Output Voltage to V_{SS} (OUT_-)	- 0.3V to ($V_{DD} + 0.3V$)	Soldering Temperature (reflow)	+260°C
Output Short-Circuit Duration (OUT_-)	1s		

PACKAGE THERMAL CHARACTERISTICS (Note 1)

μ MAX	SO		
Junction-to-Ambient Thermal Resistance (θ_{JA})	206.3°C/W	Junction-to-Ambient Thermal Resistance (θ_{JA})	132°C/W
Junction-to-Case Thermal Resistance (θ_{JC})	42°C/W	Junction-to-Case Thermal Resistance (θ_{JC})	38°C/W

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

6	6	INB-	Channel B Negative Input
7	7	OUTB	Channel B Output
8	8	V _{DD}	Positive Supply Voltage

36V, Precision, Low-Power, 90 μ A, Dual Op Amp

Detailed Description

The MAX44248 is a high-precision amplifier that has a less than 2 μ V (typ) input-referred offset and low input voltage-noise density at 10Hz. 1/f noise, in fact, is eliminated to improve the performance in low-frequency applications. These characteristics are achieved through an auto-zeroing technique that cancels the input offset voltage and 1/f noise of the amplifier.

External Noise Suppression in EMI Form

The device has input EMI filters to prevent effects of radio frequency interference on the output. The EMI filters comprise passive devices that present significant higher impedance to higher frequency signals. See the EMIRR vs. Frequency graph in the *Typical Operating Characteristics* section for details.

High Supply Voltage Range

The device features 90 μ A current consumption per channel and a voltage supply range from either 2.7V to 36V single supply or \pm 1.35V to \pm 18V split supply.

Applications Information

The device is an ultra-high precision operational amplifier with a high supply voltage range designed for load cell, medical instrumentation, and precision instrument applications.

4–20mA Current-Loop Communication

Industrial environments typically have a large amount of broadcast electromagnetic interference (EMI) from high-voltage transients and switching motors. This combined with long cables for sensor communication leads to high-voltage noise on communication lines. Current-Loop communication is resistant to this noise because the EMI induced current is low. This configuration also allows for

low-power sensor applications to be powered from the communication lines.

The *Typical Operating Circuit* shows how the device can be used to make a current loop driver.

The circuit uses low-power components such as the MAX44248 op amp, the 16-bit MAX5216 DAC, and the high-precision 60 μ A-only MAX6033 reference. In this circuit, both the DAC and the reference are referred to the local ground. The MAX44248 op-amp inputs are capable of swinging to the negative supply (which is the local ground in this case). R3 acts as a current mirror with R_{SENSE}. Therefore, if R_{SENSE} = 50 Ω (i.e. 20mA will drop 1V) and if the current through R3 is 10 μ A when I_{OUT} is 20mA (0.05% error) then R3 = 100k Ω . R1 is chosen along with the reference voltage to provide the 4mA offset. R2 = 512k Ω for 20mA full scale or R2 = 614k Ω for 20% over-range. R_{SENSE} is ratiometric with R3, R1 independently sets the offset current and R2 independently sets the DAC scaling.

Driving High-Performance ADCs

The MAX44248's low input offset voltage and low noise make this amplifier ideal for ADC buffering. Weight scale applications require a low-noise, precision amplifier in front of an ADC. [Figure 1](#) details an example of a load cell and amplifier driven from the same 5V supply, along with a 16-bit delta sigma ADC such as the MAX11205.

The MAX11205 is an ultra-low-power (< 300 μ A, max active current), high-resolution, serial output ADC. It provides the highest resolution per unit power in the industry and is optimized for applications that require very high dynamic range with low power such as sensors on a 4–20mA industrial control loop. The device provides a high-accuracy internal oscillator that requires no external components.

MAX44248

36V, Precision, Low-Power, 90 μ A, Dual Op Amp

Layout Guidelines

The MAX44248 features ultra-low voltage and noise. Therefore, to get optimum performance follow the layout guidelines.

Avoid temperature gradients at the junction of two dissimilar metals. The most common dissimilar metals used on a PCB are solder-to-component lead and solder-to-board trace. Dissimilar metals create a local thermocouple. A variation in temperature across the board can cause an additional offset due to Seebeck effect at the solder junctions. To minimize the Seebeck effect, place the amplifier away from potential heat

sources on the board, if possible. Orient the resistors such that both the ends are heated equally. It is a good practice to match the input signal path to ensure that the type and number of thermoelectric junctions remain the same. For example, consider using dummy 0Ω resistors oriented in such a way that the thermoelectric source, due to the real resistors in the signal path, are cancelled. It is recommended to flood the PCB with ground plane. The ground plane ensures that heat is distributed uniformly reducing the potential offset voltage degradation due to Seebeck effect.
