

Ultralow Power Boost Converter with Dual Half-Bridge Switches

DESCRIPTION

Demonstration circuit 1449A is an Ultralow Power Boost Converter with Dual Half-Bridge Switches featuring the LT8415. It converts a 3V-10V source to 16V supplying 1.6mA at 3V_{in} and 10mA at 10V_{in}. The 16V output is used to bias the Dual Half-Bridges which are activated by IN1 and IN2 and are pinned out at VOUT1 and VOUT2. IN1 controls VOUT1 with the same polarity and IN2 controls VOUT2. Each Half-Bridge drives a 200pF on-board capacitor.

The LT8415 features a low noise control scheme, integrated power switch, dual half-bridge switches, schottky diode and output disconnect function, ultra-low quiescent current, built in soft-start and overvoltage protection. The LT8415 datasheet gives a complete description of the part, its operation and application information. The

datasheet must be read in conjunction with this quick start guide for working on or modifying the demo circuit 1449.

This circuit is intended for space-conscious applications such as Sensor Power, RF Memos, Low Power Actuator Bias/Control, Liquid Lens Drivers and General Purpose Bias Supplies.
